

# Do Crosscutting Concerns Cause Defects?

M. Eaddy, T. Zimmermann, K. D. Sherwood, V. Garg,  
G. C. Murphy, N. Nagappan, A. V. Aho.  
*IEEE Transactions on Software Engineering*, 2008.

Presented by Danilo Ferreira e Silva

# Motivation

Enormous effort goes into avoiding software defects

- ▶ Efforts might be better directed if we had a better understanding of their causes
- ▶ Empirical studies provide evidence that crosscutting concerns impact internal quality metrics  
(But, what about external quality?)

This study considers the possibility that **crosscutting concerns** impact one external quality: **defects**

# Methodology

- ▶ Formal model to measure the extent to which concerns are crosscutting
- ▶ Three case studies to gather data on scattering and defect counts
- ▶ Correlation analysis between scattering and defects

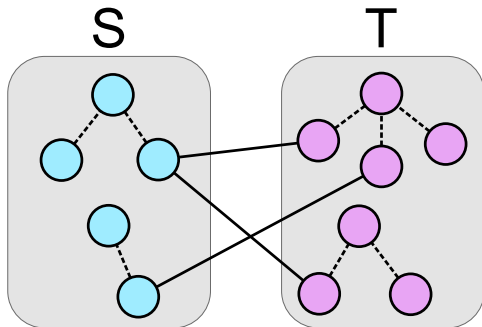

# Methodology

- ▶ Formal model to measure the extent to which concerns are crosscutting
- ▶ Three case studies to gather data on scattering and defect counts
- ▶ Correlation analysis between scattering and defects

**Moderate to strong correlation for all three case studies**

# A Model of Concerns

- ▶  $S$  is a set of concerns (items from a program's specification)
- ▶  $T$  is a set of program elements (AST nodes)
- ▶  $R = \{(s, t) \mid s \in S, t \in T\}$   
(relationship between concerns and program elements)

# Metrics

- ▶ Bug Count
- ▶ Lines of Concern Code (LOCC)
- ▶ Concern Diffusion over Components (CDC)
- ▶ Concern Diffusion over Operations (CDO)
- ▶ Degree of Scattering across Classes (DOSC)
- ▶ Degree of Scattering across Methods (DOSM)

# Metrics: Degree of Scattering

$$CONC(s, t) = \frac{\text{Source lines in element } t \text{ related to concern } s}{\text{Source lines related to concern } s}$$

$$Variance(s) = \frac{\sum_{t \in T} (CONC(s, t) - CONC_{worst})}{|T|}$$

$$DOS(s) = 1 - \frac{Variance(s)}{Variance_{ideal}(s)}$$

DOSC = 1.00  
CDC = 4

DOSC = 0.08  
CDC = 4

# Bug-concern mapping

1. Reverse engineer the concern-code mapping (manual)
  - 1.1 Concern selection
  - 1.2 Concern assignment (prune dependency rule)
2. Mine the bug-code mapping (partially automated)
  - 2.1 Associating bugs with bug fixes
  - 2.2 Associating bugs with program elements
3. Infer the bug-concern mapping

# Bug-concern mapping

1. Reverse engineer the concern-code mapping (manual)
  - 1.1 Concern selection
  - 1.2 Concern assignment (prune dependency rule)
2. Mine the bug-code mapping (partially automated)
  - 2.1 Associating bugs with bug fixes
  - 2.2 Associating bugs with program elements
3. Infer the bug-concern mapping

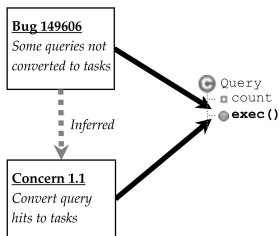

# Bug-concern mapping

# Case Studies

Project characteristics:

- ▶ Open-source
- ▶ Java (tooling limitation)
- ▶ Production quality
- ▶ Identifiable concerns (at least 30)
- ▶ Accessible Issue Tracking System (ITS)
- ▶ Consistently referenced bugs (commit messages)

# Case Study 1

## Mylyn-Bugzilla

- ▶ Plug-in for the Eclipse IDE that enables task-focused methodology
- ▶ 28 concerns identified
  - *Convert query hits to tasks*
  - *Support search for duplicates*
- ▶ Concerns and bugs assigned manually

# Case Study 2

## Rhino

- ▶ Javascript interpreter
- ▶ Hierarchy of 480 concerns (357 leaves) extracted from the ECMAScript Standard
  - *Regular Expression Literals*
  - *Scope Chain and Identifier Resolution*
- ▶ Concerns assigned manually

# Case Study 3

## iBatis

- ▶ Object-relational mapping tool
- ▶ Hierarchy of 183 concerns (132 leaves) extracted from the Developer's Guide
  - *Caching*
  - *Request Caching*
  - *Class Caching*
- ▶ Concerns assigned manually

# Coverage Statistics

	<i>Mylyn–Bugzilla</i>			<i>Rhino</i>			<i>iBATIS</i>		
	All	Mapped <sup>a</sup>	%	All	Mapped	%	All	Mapped	%
<i>Classes</i>	56	44	79	138	80	57	212	207	97
<i>Methods</i>	427	253	59	1870	1415	75	1844	1807	97
<i>Fields</i>	457	230	50	1339	962	71	536	529	98

<i>CDO</i>	—	—	—	.77	<b>.44</b>
<i>LOCC</i>	—	—	—	—	<b>.53</b>

(c) iBATIS

- ▶ Moderate to strong correlation for all three case studies
- ▶ CDC and CDO were more strongly correlated

# Testing for the Confounding Effect of Size

- ▶ The size of the concern has a strong correlation with defects
- ▶ There is also a strong correlation between scattering metrics and size
- ▶ Test for a confounding effect
  - Stepwise Regression Analysis
  - Principal Component Analysis (PCA)

## Conclusion

Size is not the single dominating factor, the scattering metrics contribute toward explaining the variance in bug count

# Threats to Validity

## Internal Validity

- ▶ Concern assignment unreliability
- ▶ Bug assignment errors
- ▶ Concern and bug assignments at the member level (not at statement level)

## External Validity

- ▶ Results may not generalize
  - Programming language
  - Complexity of the problem domain
  - Tool support
  - etc

# Conclusion

## Main Contribution

Empirical evidence suggesting that crosscutting concerns cause defects

- ▶ Further studies are needed to draw general conclusions

## Remaining Questions

- ▶ Can we reduce the likelihood of defects by reducing crosscutting?
- ▶ Are crosscutting concerns a byproduct of programming technology, developer aptitude, or the inherent complexity of the concern?
- ▶ What is the relationship between code churn and scattering?

**Thanks!**
